Algorithms Used For Generating Graph Patterns

Idea is to sample non-zero contributions of the partition function at $T = T_c$. Express them in a way as to form 'loops'.

Idea is to sample non-zero contributions of the partition function at $T = T_c$. Express them in a way as to form 'loops'.

Ising Model

Ising Loop Expansion

hi

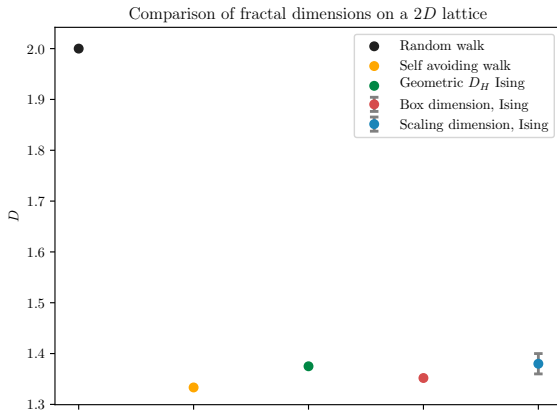

Box Dimension

Scaling Dimension

Comparison of Dimensions $2D$ Ising

Largest Ising Loop on a 128^2 Lattice

XY Model

Rotors... Loop Expansion. Adds complexity as a direction and weight.
Use Villain approximation \Rightarrow Displaces $T_c \Rightarrow$ Use winding number to
'find' T_c .

Explain how winding numbers can show T_c . Maybe illustrations.

Winding Number

- Hove, Mo and Sudbo: $D_H = 2.287 \pm 2 \cdot 10^{-3}$
- Prokof'ev and Svistunov Comment: $D_H = 1.7655 \pm 2 \cdot 10^{-3}$

Box Counting Method 3D XY

Comparison of Dimensions $3D$ XY

	D_H
Box	1.35193(5)
Scaling	1.38(2)
D_H^G	1.375
SAW	1.33
Random Walk	2

Table 1: 2D Ising

	D_H
Box	1.77468(4)
Prokof'ev	1.765(2)
Sudbo	2.287(2)

Table 2: 3D XY
